* Estimations are based on data reported/confirmed by National Disaster Management Organisations of each respective ASEAN Member State and other verified sources

Indonesia

- Several provinces in Sulawesi were affected by flood due to the heavy rainfall. The National Disaster Management Organisation of Indonesia, [Badan Nasional Penanggulangan Bencana \(BNPB\)](#) reported that the high-intensities rainfall may be caused by the Madden Julian Oscillation effects as it entered the Indian Ocean.
- The flood occurred in the provinces of Central Sulawesi, South Sulawesi, and Southeast Sulawesi which are believed to be the most affected areas, especially North Konawe sub-district.
- The local government has declared flood response emergency status for 14 days from 2-16 June 2019 in North Konawe sub-district. The disaster has affected 1,420 families, and 5,111 people were displaced. In addition, there are 1,235 houses reported to be inundated while another 185 houses were damaged.
- According to [BNPB](#), local DMO (BPBD) cannot reach several isolated areas due to the strong water current. Moreover, damaged public infrastructures like bridges are also the major obstacles for evacuation process and the delivery of logistical assistance.
- While responding to the disaster that occurred in several of these areas, [BNPB](#) continued to monitor and dispatch rapid response and assessment teams to the field.
- AHA Centre will monitor continuously and issue update should there be any significant development of the estimation of the situation.
